                         AAY96583-87 are (partial) isoflavone O-methyltransferases isolated from various soybean (Glycine max) tissues. CDNA libraries set, srl, strlc and ssllc were prepared from soybean embryo (19 days after flowering), root, 8-day old root and seed (25 days after flowering).

Isoflavone O-methyltransferase catalyses the first step in degradation of daidcain. Suppression of this enzyme will yield higher concentrations of this beneficial isoflavone in. e.g. soybean seed. Ravonoids serve as co-pigments in flower colour, stimulate pollen tube growth, attract pollenators, act as feeding deterrents and protect against UV isradiation in fruits and seeds. The cDNA and proteins can be used to isolate homologues, for immunological screening and for positive

AAY96583-87 are (partial) isoflavone O-methyltransferases isolated from various soybean (Glycine max) tissues. CDNA libraries set, srl, srrlc and sell were prepared from soybean embryo (19 days after flowering), root, 8-day old root and seed (25 days after flowering).

Isoflavone O-methyltransferase catalyses the first step in degradation of dialdzein. Suppression of this enzyme will yield higher concentrations of this beneficial isoflavone in, e.g. soybean seed. Plavonoids serve as co-pigments in flower colour, stimulate pollen tube growth, attract pollenators, act as feeding deterrents and protect against UV irradiation in fruits and seeds. The cDNA and proteins can be used to selection methods.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                     AAY96583-87 are (partial) isoflavone O-methyltransferases isolated from various soybean (Glycine max) tissues. cDNA libraries se4, sr1, srr1c and sellc were prepared from soybean embryo (19 days after flowering), root, 8-day old root and seed (25 days after flowering).

Isoflavone O-methyltransferase catalyses the first step in degradation of daidzein. Suppression of this enzyme will yield higher concentrations of this beneficial isoflavone in, e.g. soybean seed. Flavonoids serve as co-pigments in flower colour, stimulate pollen tube growth, attract pollentenses, act as feeding deterrents and protect against UV irradiation in fruits and seeds. The cDNA and proteins can be used to insolate homologues, for immunological screening and for positive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 63 ILQVPPTKTRQVQSLMRYLAHNGFFEIVRIHDNIE-AYALTAASELLVKSSELSLAPMVE 121

AAY96583-87 are (partial) isoflavone O-methyltransferases isolated from various soybean (Glycine max) tissues. CDNA libraries se4, sr1, srrlc and sellc were prepared from soybean embryo (19 days after flowering), root, 9 day old root and seed (25 days after flowering).

Isoflavone O-methyltransferase catalyses the first step in of daidzein. Suppression of this enzyme will yield higher concentrations of this beneficial isoflavone in, e.g. soybean seed. Flavonoids serve as co-pigments in flower colour, stimulate pollen tube growth, attract pollentucis, act as feeding deterrents and protect against UV irradiation in fruits and seeds. The CDNA and proteins can be used to isolate homologues, for immunological screening and for positive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  TKTROVOSLMRYLAHNGFFEIVRIHDNIE-AYALTAASELLVKSSELSLAPMVEYFLEPN 127

CDNA libraries se4, sr1, srr1c and self were prepared from soybean embryo (19 days after flowering), root, 8-day old root and seed (25 days after flowering).

Isoflavone O-methyltransferase catalyses the first step in degradation of daidzein. Suppression of this enzyme will yield higher concentrations of this beneficial isoflavone in, e.g. soybean seed. Plavonoids serve as pollenators, act as feeding deterrents and protect against UV irradiation in fruits and seeds. The CDNA and proteins can be used to instant and seeds. The cDNA and proteins can be used to instant in concerning and for positive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         99

A vector containing the DNA can be used to transform a microbe for the recombinant preparation of the enzyme. The enzyme can be used to prepare a secondary metabolite of a plant derived from reticuline which is useful as a raw

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              67
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is a caffeic O-methyltransferase, encoded by a cDNA clone (see AAX25200) isolated from a line A643 cDNA library. The invention provides methods and compositions relating to altering lignin biosynthesis and/or the lignin composition of plants. Isolated nucleic acids (see AAX25196-216) that code for proteins (see AAX05657-77) involved in lignin biosynthesis are claimed. Also claimed are recombinant expression cassettes, host cells (especially maize or sorghum), and transgenic plants and seeds. The claimed nucleic acids can be used to transform a plant to modulate lignin biosynthesis. A claimed method involves transforming a plant cell with a recombinant expression cassette or promoter, growing the plant cell under plant growing conditions, and inducing expression of the polynucleotide for a time sufficient or modulate (preferably increase) lignin biosynthesis in the plant. The plant lignins can be used as a time sufficient material of increased lignin content can be used as a fuel source, immunes the algorithmic content can be used as a fuel source, immunes the algorithmic follows.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        11 ASEIFQGQALLYKHLLGFIDSKCLKWNVELDIPDIIHSHSHGQPITFSELVSILQVPPTK

The invention provides methods and compositions relating to altering lignin biosynthesis and/or the lignin composition of plants. Isolated mucleic acids (see AAX25196-216) that code for plants. Isolated mucleic acids (see AAX25196-216) that code for claimed. Also claimed are recombinant expression cassettes, host calls (especially maize or sorghum), and transgenic plants and calls (especially maize or sorghum), and transgenic plants and calls (especially maize or sorghum), and transgenic plants and calls (especially maize or sorghum), and transgenic plants and calls (especially maize or sorghum), and transgenic plants and calls (especially maize or sorghum), and transgenic plants or modulate lignin biosynthesis. A claimed method involves transforming a plant cell with a recombinant expression cassette comprising a lignin biosynthesis polymucleotide for a time sufficient or modulate (preferably increase) lignin biosynthesis in the plant. The plant lignins can be used as chemical feedstock, plant material of increased lignin content can be used as a fuel source, and in the pulp and paper industry. Decreased lignin content
                                                                  Nucleic acids encoding plant lignin biosynthesis enzymes - used to transform plants to modulate lignin biosynthesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Maize; corn; caffeic O-methyltransferase; lignin; transgenic plant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 22-JUN-1999
23-JUN-1999
              11;
concoded by a clone (see AAX25202) isolated from a maize line B73 cDNA library. The invention provides methods and compositions relating to altering lighin biosynthesis and/or the light composition of plants. Isolated nucleic and/or the light code for plants. Isolated nucleic and/or the light biosynthesis are claimed. Also claimed are recombinant expression cassettes, host cells (especially maize or sorghum), and transgenic plants and seeds. The claimed nucleic acids can be used to transform a plant to modulate light biosynthesis. A claimed method involves to modulate light biosynthesis polynucleotide operably linked to a promoter, growing the plant cell under plant growing conditions, and inducing expression of the polynucleotide operably linked to a promoter, growing the plant cell under plant growing conditions, and inducing expression of the polynucleotide for a time sufficient to modulate (preferably increase) light biosynthesis in the plant. The plant lightin content can be used as a fuel source, material of increased light content can be used as a fuel source, and in the pulp and paper industry. Decreased light content canse improves the digestibility of fodder crops.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         QVPPTKTRQVQSLMRYLAHNGFFEIVRIHDNI-EAYALTAASE--LLVKSSELSLAPMVE 121

Sequence 4, Application US/09500569

Sequence 4, Application US/09500569

Patent No. 6329204

GENERAL INFORMATION:
APPLICANT: Cahoon, Rebecca E.
APPLICANT: Rafalski, Antoni
TITLE OF INVENTION: Plant Caffeic acid 3-O-Methyltransferase Homologs
TITLE OF INVENTION NUMBER: US/09/500,569

CURRENT PAPLICATION NUMBER: G0/119,587

EARLIER APPLICATION NUMBER: 60/119,587

SALLIER PRING DATE: 1999-February-10

NUMBER OF SEQ ID NOS: 28

SEQ ID NO 4

SEQ ID NO 4

Sequence 6, Application US/08991677A

Patent No. 6252135

GENERAL INFORMATION:

APPLICANT: Chiang, Vincent L

APPLICANT: Carraway, Daniel T

APPLICANT: Smeltzer, Richard H

TITLE OF INVENTION Production of Syringyl Lignin in Gymnosperms

FILE REFERENCE: 50617

CURRENT APPLICATION NUMBER: US/08/991,677A

CURRENT FILING DATE: 1997-12-16

EARLIER APPLICATION NUMBER: US 60/033,381

EARLIER PILING DATE: 1996-12-16

NUMBER OF SEQ ID NOS: 11

SOFTWARE: PatentIn Ver. 2.0

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 4, 7

caffeate O-methyltransferase (BC 2.1.1.68) - alfalfa
C;Species: Medicago sativa (alfalfa)
C;Species: Medicago sativa (alfalfa)
C;Species: Medicago sativa (alfalfa)
C;Species: Medicago sativa (alfalfa)
C;Species: Jul-1999 #sequence_revision 16-Jul-1999 #text_change 21-Jul-2000
C;Accession: T06673
R;Gowri, G; Bugos, R.C.; Campbell, W.H.; Maxwell, C.A.; Dixon, R.A.
Plant Physiol. 97, 7-14, 1991
A;Tile: Molecular cloning and expression of alfalfa S-adenosyl-L-methionine: caffe
A;Reference number: Z16815
A;Reference number: Z16813
A;Status: preliminary, translated from GB/BMBL/DDBJ
A;Status: preliminary, translated from GB/BMBL/DDBJ
A;Status: preliminary, translated from GB/BMBL/DDBJ
A;Residues: 1-365 cGOMs
A;Residues: 1-365 cGOMs
A;Residues: 1-365 cGOMs
A;Residues: Justiniary Surces: Subspecies sativa, cultivar Apollo
C;Runction: A;Pathway: lignin biosynthesis
C;Superfamily: O-methyltransferase; S-adenosylmethionine
